with a modified polylinker; Plasmid DNA from the
normalized library NCI_CGAP_Pr22 was prepared, and ss
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from a pool
of 5,000 clones made from the same library (cloneIDs
985608-986759, 110192-1101959, and 1217928-1220615).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4-80 years and RNA was extracted. From this pooled sample an aliquot of 60ug of total RNA yielded 2.17ug of mRNA. A directionally cloned cDNA library in the pCMVSPORT6 vector was constructed at Life Technologies, essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I primer adapter [5'.pGACTAGTTCTAGATCGCAGGGGCCCCC(T)15-3']. Not I/Diunt end inserts were cloned into the Not I/Ecor V sites in the vector. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing

The sequence may be expressed in e.g. COS-7 cells. The encoded protein, its ligands or fragments, and antibodies may be used for the treatment of transplant rejection, graft-versus-host disease, autoimmune disease, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated ACT-4 receptor from activated T-cells - also its ligands antibodies, useful for treating diseases of the immune system \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Buck

The sbp and its fragments are useful in pharmaceutical compositions to modify a patient's immune response as well as having application in the treatment of transplant rejection, graft versus host disease, autoimmune disease, inflammation, infectious agents, HTLV infected cells or HIV. Specifically the sbd can be used to treat inflammatory bowel disease. The sbd can also be used for screening for immunomodulatory agents able to recognise ACT-4 and for monitoring activated CD4 positive cells or inhibiting infection of CD4 positive cells.

PCR primers were designed and used to clone murine OX-40 CDNA by PCR from RNA isolated from murine CD4+ T-cells activated with concanavalin A. Then the murine OX-40 CDNA was used to probe a cDNA lambda gtll library from human activated T lymphocytes to obtain human OX-40 CDNA. The published patent application states that the OX-40 CDNA sequence is also in SQ ID no. 1, but this sequence is not present in the spec. A nucleic acid having the sequence in SQ ID no 1 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Stimulatory primary signalling motif; immune cell; signal transduction; chimeric receptor; inflammatory disease; autoimmune disease; asthma; eczema; congenital disease; cystic fibrosis; sickle cell anemia; dermatological disease; psoriasis; neurological disease; multiple sclerosis; transplant-related disease; metabolic disease; organ transplant rejection; graft versus host disease; organ transplant rejection; graft versus host disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide

The specification describes stimulatory primary signalling motifs. Primary motifs are efficient at at mediating immune cell signal transduction, particularly when incorporated in an intracellular signalling domain of a chimeric receptor. The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating lumman patients suffering from infectious diseases e.g. human fumunodeficiency virus (HIV) infections, inflammatory/autoimmune diseases such as asthma and eczema, congenital diseases e.g. cystic fibrosis, sickle cell anemia, dermatological diseases e.g. sporiasis, neurological diseases e.g. multiple sclerosis, transplant related disease e.g. organ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC a consensus amino acid sequence. These motifs are extremely efficient at mediating immune cell signal transduction, particularly converted into an intracellular signalling domain of a chimeric receptor. Nucleic acids that encode, and polypeptides that contain, content of these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for treating or preventing disease in humans or in animals. These diseases cinclude infections (e.g. HTV (human immunodeficiency virus) infection), confine in the contain of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

σ

```
CC receptor protein comprising an extracellular ligand-binding domain, a CC receptor protein comprising an extracellular signalling domain. The CC intracellular signalling domain and the comprises the cytoplasmic portion of at CC least one adaptor protein, and the extracellular ligand-binding domain in not CD8 or a major histocompatibility complex (MHC) class I protein. CC The adaptor receptor protein and the nucleic acid encoding it are useful in therapy. They are useful in the manufacture of a medicament for the CC treatment or prevention of disease in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection), CC congenital diseases (e.g. cystic fibrosis and sickle cell anaemia), CC congenital diseases (e.g. cystic fibrosis and sickle cell anaemia), CC dermatological diseases (e.g. psoriasis), neurological diseases (e.g. psoriasis), 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotide encoding adaptor receptor protein useful for treating human immunodeficiency virus (HIV) infection, asthma, cyfibrosis, multiple sclerosis, organ transplant rejection, diabete cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 3;

The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating human patients suffering from infectious diseases e.g. human immunodeficiency virus (HIV) infections, inflammatory/autoimmune diseases such as asthma and eczema, congenital diseases e.g. cystic fibrosis, sickle cell anemia, dermatological diseases e.g. psoriasis, neurological diseases e.g. multiple scierosis, transplant-related disease e.g. organ transplant rejection, graft versus host disease, metabolic/idiopathic

The specification describes stimulatory primary signalling motifs. Primary motifs are efficient at at mediating immune cell signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    scierosis,

The invention relates to novel primary signalling motifs containing CC a consensus amino acid sequence. These motifs are extremely cefficient at mediating immune cell signal transduction, particularly when incorporated into an intracellular signalling domain of a chimeric creceptor. Nucleic acids that encode, and polypeptides that contain, ct these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for contracting or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), inflammatory or autoimmune diseases (e.g. asthma or eczema), congenital confidences (e.g. psoriasis), neurological diseases (e.g. psoriasis), neurological diseases (e.g. muttiple classes (e.g. psoriasis), neurological diseases (e.g. muttiple conserved to a large number of oligonucleotides used in the construction of sequence blocks (SBs) of primary and secondary constitution of the T cell receptor (TCR) complex. Secondary conserved in part secondary or constitution of the T cell receptor (TCR) complex. Secondary conserved in part secondary or constitution of sequence stimulatory or an inhibitory signal manual which regulates used in the tell support of the T cell receptor (TCR) complex. Secondary consolies in T cells.

                                                                                                                                                                                                                                                       inflammatory and autoimmune diseases (e.g. asthma and eczema), depending diseases (e.g. cystic fibrosis and sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g.) multiple sclerosis) organ transplant rejection, graft-versus-host disease and metabolic/idiopathic diseases such as diabetes and cancer. The present sequence is one of a large number of oligonucleotides used in the construction of sequence blocks (SBs) of primary and secondary signalling motifs transduce either a stimulatory or an inhibitory signal, which regulates primary activation of the T cell receptor (TCR) complex. Secondary signalling motifs may be used as components of the adaptor receptor protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisickling; antipsoriatic; neuroprotective; immunosuppressive; antidiabetic; cytostatic; HIV infection; inflammation; autoimmune disease; cystic fibrosis; sickle cell anaemia; psoria neurological disease; organ transplant rejection; diabetes; canc
                                                                                                                                                                                                                                                                                                                                                                                                                             is not CD8 or a major histocompatibility complex (MHC) class I protein. The adaptor receptor protein and the nucleic acid encoding it are useful in therapy. They are useful in the manufacture of a medicament for the treatment or prevention of disease in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel nucleic acid encoding an adaptor a receptor protein comprising an extracellular ligand-binding domain, a transmembrane domain and an intracellular signalling domain. The intracellular signalling domain comprises the cytoplasmic portion of at least one adaptor protein, and the extracellular ligand-binding domain least one adaptor protein, and the extracellular ligand-binding domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotide encoding adaptor receptor protein useful for treating human immunodeficiency virus (HIV) infection, asthma, cynfibrosis, multiple sclerosis, organ transplant rejection, diabetee
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           graft-versus-host disease; adaptor receptor protein; sequence block;

                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents the mouse OX40 extracellular domain encoding cDNA. The extracellular domain of OX40 is its ligand binding domain. The present cDNA was used in the construction of the chimeric OX40/Fc cDNA (AAV32640). The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the OX40 murine T cell antigen. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2

The Fc fragment may be derived from human IgG1, and the plasmid may be used to transform the CV-1/EBNA (ATCC CRL 10478) monkey kidney cell line. Culture supernatant was purified by affinity chromatography and this was used, together with labeled goat anti-human IgG to

The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytokine (AAW4897 that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.
                                                                                                                (WEIN/)
                             Nucleic acid encoding an activated T-cell antigen, Ox-40 - used develop prods. for detection and therapy of conditions mediated activated T-cells, eg. multiple sclerosis, rheumatoid arthritis,

                            The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences; and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and material form part of a set of probes for detecting the cytosine methylation and/or single nucleotide polymorphisms and also to be used in an array for analysing diseases associated with CpG dinucleotides e.g. cancers and tumours. The probes can also be used in a method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigen OX-40 is specifically expressed on the cell surface of antigen activated T-cells, especially, for example, CD4+ T-cells. A human cDNA encoding the human OX-40 homologue was cloned using primers 1 and 2. Template DNA for PCR amplification to product the human OX-40 cDNA can be extracted from the lambda GT11 cDNA library from human activated T-lymphocytes produced by Clontech, Palo Alto, California (Catalog No. HL10316).

The present invention describes differentially expressed gene in anglogenesis (I), and the polypeptides that encode them. (cardiovascular activity, and can be used in the modulation of anglogenesis. The nucleic acids and polypeptides may be used prevention, diagnosis and treatment of diseases associated wi

AAH22255 to AAH22325 and AAB98322 to AAB98325 represent sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inappropriate angiogenesis. The polypeptides may also be used as antigens in the production of antibodies against them and in assays to identify modulators of their expression and activity. The antibodies and antipodies and antipodies and antipodies and activity and modulate angiogenesis. The antibodies may also be used to down regulate expression and activity and modulate angiogenesis. The antibodies may also be used as diagnostic agents for detecting the presence of the polypeptides in samples. Disorders that may be prevented, diagnosed and/or treated by the above methods include, for example vascular tumours, proliferative tumours, proliferative vitreoretinopathy, rheumatoid arthritis. Crohn's disease, the proliferative vitreoretinopathy, rheumatoid arthritis.

antiarteriosclerotic and cytostatic. The secreted proteins and their polynucleotides can be used in gene therapy and as vaccines, chemotaxis-modulators and anglogenesis-modulators. The human secreted proteins and polynucleotides can be used for diagnosing (the susceptibility to) a pathological condition by determining the presence or absence of a mutation in the polynucleotide or determining the presence or amount of expression of the protein. The polynucleotides and proteins can also be used in the treatment and diagnosis of cancer,
                                                     diseases of the immune system, hyperproliferative disorders, cardiovascular disorders and neurological disease. They can also be used to promote wound healing and to fight infection. AAA87657 to AAA87665 are AAB25664 represent sequences used in the exemplification of the present

Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: immunosuppressive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc which represent the human OFFX open reading frames I to 316. The OFFX csequences have activities such as: cytostatic; hepatotropic; vulnerary; cc antiporiatic; anticonvulsant; antiarthritic; immunosuppressant; cc immunostinulant; cardiant; thrombolytic; coagulant; vasotropic; cc antidiabetic; hypotensive; dermatological; immunosuppressant; cc antidiabetic; hypotensive; dermatological; immunosuppressive; antiporiation; antibacterial; antiviral; antifungal; antirheumatic; cc antithyroid; and antianaemic. The sequences can be used for determining ct the presence of or predisposition to, or preventing or treating cc the presence of or predisposition to, or preventing or treating cc pathological conditions associated with an OFFX-associated disorder. The cnucleic acids can be used to express OFFX proteins in gene therapy cetors. The proteins and nucleic acids may be used to treat cancers, crolliferative disorders, neurodegenerative disorders, ostecarthritis, cf yraft vs host disease, cardiovascular disease, diabetes mellitus, thypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, altoriman of ungal infection, malaria, autoimmune disorders, asthma, callergies, aplastic anaemia, burns, wounds, board artilage damage, coccurral haemoglobinuria, antiinflammatory disease; to enhance

                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78333-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity in activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides human phosphatases (PP) and polynucleotides encoding the phosphatases. The polypeptides can be expressed by standard recombinant methodology. The PP are useful for treating a disease or condition associated with decreased expression of functional phosphatases. Compositions containing agonists or antagonists of PP may be used to treat a disease associated with decreased expression or overexpression of PP, respectively. Such diseases may include Alzheimer's disease, Huntington's disease, immune disorders, and cancers. The present sequence represents a human phosphatase encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel genes (AAL34669-AAL37666) and proteins C (ABB03087-ABB04109) associated with the musculoskeletal system useful CC for preventing, treating or ameliorating medical conditions e.g. by CC protein or gene therapy. The genes are isolated from a range of human C tissues disclosed in the specification. The nucleic acids, proteins, CC antibodies and (antiagonists are useful in the diagnosis, treatment CC and prevention of: (a) cancer, e.g. breast and ovarian cancer and CC other cancers of the adrenal gland, bone, bone marrow, breast, CC gastrointestinal tract, liver, lung, or urogenital; (b) immune CC disorders e.g. Addison's disease, allergies, autoimmune hemolytic CC anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, CC multiple sclerosis, rheumatoid arthritis and ulcerative colitis; CC (c) cardiovascular disorders such as myocardial ischaemias; (d) wound CC healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and of the fortions diseases such as viral, bacterial, fungal and

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis an treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a pattient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I)

                                                                                                                                    CC AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic continity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and ctreatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome cc that affect the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting CC the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent. CC diagnose and treat immune/haematopoietic-related diseases, especially CC cancers and cancer metastases of haematopoietic antigen genomic CC sequences from the present invention. AAK54950 and AAM82169 CC represent sequences used in the exemplification of the present invention.

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
  'Drosophila;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL116176-ABL30511), expressed DNA sequences (ABL116176-ABL30511) sepressed DNA (ABB57737-ABB72072).

(I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polyuncleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polyuncleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially

antagonists may also be used to down regulate expression and activity and modulate angiogenesis. The antibodies may also be used as diagnostic agents for detecting the presence of the polypeptides in samples. Sisorders that may be prevented, diagnosed and/or treated by the above methods include, for example vascular tumours, proliferative tumours, proliferative tumours, crohn's disease, atherosclerosis, ovarian hyperstimulation, psoriasis, endometriosis associated with neovascularisation, restenosis subsequent to balloon angioplasty, scar tissue over production, peripheral vascular disease, hypertension, inflammatory vasculitides, Reynaud's disease and Reynaud's phenomenon, aneurysms, arterial restenosis, thrombophlebitis, lymphedema, wound healing and tissue repair, ischaemia creperfusions injury, angina, myocardial infarctions, chronic heart conditions, heart failure such as congestive heart failure, age-related macular degeneration and osteoporosis. AAH22255 to AAH22325 and AAB98322 crepresent sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inappropriate angiogenesis. The polypeptides may also be used as antigens in the production of antibodies against them and in assays to identify modulators of their expression and activity. The antibodies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes differentially expressed genes involved in angiogenesis (I), and the polypeptides that encode them. (I) have cardiovascular activity, and can be used in the modulation of angiogenesis. The nucleic acids and polypeptides may be used in the prevention, diagnosis and treatment of diseases associated with
                                                     present invention.

             The present invention provides the protein and coding sequences number of human digestive system antigens. These can be used in diagnosis, treatment and prevention of digestive system disorder including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic coliticularies and the present sequence is a cDNA encoding a discretive colitis. The present sequence is a cDNA encoding a discretive colitis.
                                                                                                                                                                           Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders digestive system, particularly cancer and cancer metastases.
                                                                                                                                           Claim
